Acrylic Spa Owner’s Manual

Customer Service 1•800•787•6649

READ AND FOLLOW ALL INSTRUCTIONS

Unit is IPX5 Compliant
Congratulations on your purchase!

Your new spa will bring you years of enjoyment and relaxation.

Please take the time to familiarize yourself with the safety precautions, and operational procedures, as well as the routine water maintenance and cleaning so that your spa will provide a healthy environment for all your bathers.

Enjoy!

Strong™ Spas
3204 Point Township Drive, Northumberland, PA 17857 USA

The manufacturer reserves the right to make product modifications and enhancements without notice.
Specifications and dimensions are approximate and for reference only.
Important Safety Instructions and Warnings

READ AND FOLLOW ALL INSTRUCTIONS

To reduce the risk of injury, do not permit children to use this product unless they are closely supervised at all times.

**Warning:** Children should not use spas or hot tubs without adult supervision.
**Avertissement:** Ne pas laisser les enfants utiliser une cuve de relaxation sans surveillance.

**Warning:** Do not use spas or hot tubs unless all suction guards are installed to prevent body and hair entrapment.
**Avertissement:** Pour éviter que les cheveux ou une partie du corps puissent être aspirés, ne pas utiliser une cuve de relaxation si les grilles de prise d’aspiration ne sont pas poutes en place.

**Warning:** People using medications and/or having an adverse medical history should consult a physician before using spa or hot tub.
**Avertissement:** Les personnes qui prennent des medicaments ou ont des problemes de sante devraient consulter un medicin avant d’utiliser une cuve de relaxation.

**Warning:** Do not use drugs or alcohol before or during the use of a spa or hot tub, to avoid unconsciousness and possible drowning.
**Avertissement:** Pour éviter l’évanouissement et la noyade éventuelle, ne prendre ni drogue ni alcool avant d’utiliser une cuve de relaxation ni quand on s’y trouve.

**Warning:** Pregnant or possibly pregnant women should consult a physician before using a spa or hot tub.
**Avertissement:** Les femmes enceintes, que leur grossesse soit confirmée ou non, devraient consulter un médecin avant d’utiliser une.

**Warning:** Water temperature in excess of 38°C may be injurious to your health.
**Avertissement:** Il peut être dangereux pour la santé de se plonger dans de l’eau à plus de 38°C.

**Warning:** Before entering the spa or hot tub, measure the water temperature with an accurate thermometer.
**Avertissement:** Avant d’utiliser une cuve de relaxation mesurer la température de l’eau à l’aide d’un thermomètre précis.

**Warning:** People with infectious diseases should not use a spa or hot tub.
**Avertissement:** les personnes atteintes de maladies infectieuses ne devraient pas utiliser une cuve de relaxation.

**Warning:** To avoid injury, exercise care when entering or exiting the spa or hot tub.
**Avertissement:** Pour éviter des blessures, user de prudence en entrant dans une cuve de relaxation en sortant.

**Warning:** Do not use a spa or hot tub immediately following strenuous exercise.
**Avertissement:** Ne pas utiliser une cuve de relaxation immédiatement après un exercise fatigant.

SAVE THESE INSTRUCTIONS
Important Safety Instructions and Warnings

READ AND FOLLOW ALL INSTRUCTIONS

To reduce the risk of injury, do not permit children to use this product unless they are closely supervised at all times.

Warning: Prolonged immersion in a spa or hot tub may be injurious to your health.

Avertissement: L'utilisation prolongée d'une cuve de relaxation peut être dangereuse pour la santé.

Warning: Do not permit or use electrical appliances (such as a light, telephone, radio or television) within 1.5 meters of spa or hot tub.

Avertissement: Ne pas placer d'appareil électrique (luminaire, téléphone, radio, téléviseur, etc.) à moins de 1.5 meters de cette cuve de relaxation.

Caution: Maintain water chemistry in accordance with the manufacturer’s instructions.

Attention: La teneur de l'eau en matières dissoutes doit être conforme aux directives du fabricant.

Caution: In order to avoid a hazard due to inadvertent resetting of the thermal cut-out, this appliance must not be supplied through an external switching device, such as a timer, or connected to a circuit that is regularly switched on and off by the utility.

HYPERTHERMIA

Hyperthermia occurs when the internal temperature of the body reaches a level several degrees above the normal body temperature of 37°C. The symptoms of hyperthermia include:

1) Unawareness of impending hazard;
2) Failure to perceive heat;
3) Failure to recognize the need to exit the spa or hot tub;
4) Physical inability to exit the spa or hot tub;
5) Fetal damage in pregnant women; and
6) Unconsciousness and resulting in the danger of drowning.

Warning: The use of alcohol or drugs can greatly increase the risk of fatal hyperthermia in hot tubs or spas.

Avertissement: La consommation d'alcool ou de drogue augmente considérablement.

Warning: The appliance is not to be used by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction.

SAVE THESE INSTRUCTIONS
Prepare for Your New Spa

Prepare for Your New Spa
Most cities and counties require permits for exterior construction and electrical circuits. In addition, some communities have codes requiring residential barriers such as fencing and/or self-closing gates on property to prevent unsupervised access to the property by children. Your local code enforcement officer can provide information on which permits may be required and how to obtain them prior to the delivery of your spa.

Prepare a Good Foundation
Damage caused by an inadequate or improper foundation is not covered by the warranty. The spa owner is responsible for providing a proper foundation. Place the spa on a solid, level foundation. If you are installing the spa indoors (not recommended), pay close attention to the flooring beneath it. Choose flooring that will not be damaged or stained. If you are installing your spa on an elevated wood deck or other structure, consult a structural engineer or a contractor to ensure the structure will support the weight of 150 pounds per square foot. An adequate drainage system has to be provided to deal with overflow water.

Plan the Best Location
SAFETY FIRST
Do not place your spa within 10 feet (3 m) of overhead power lines.

Do not use in warm, damp, equable climates.

IMPORTANT: The Warranty is void if the spa is moved to any location that is not the original ‘Ship To’ address.

Consider Spa Use
How you intend to use your spa will help you determine where you should position it. For example, will you use your spa for recreational or therapeutic purposes? If your spa is mainly used for family recreation, be sure to leave plenty of room around it for activity. If you will use it for relaxation and therapy, you will probably want to create a specific mood around it.

Climate, Privacy and View
Place the spa near a house entry if you live in a snowy or rainy environment so you have a place to comfortably change clothes. Consider seasonal changes, too. Bare trees don’t provide much privacy. And don’t forget to think of your neighbors’ view of you, and your view of your neighbors.

Keep Your Spa Clean
In planning your spa’s location, consider a location where there is a clean path to and from the house. Use a mat at the spa’s entrance to encourage bathers to clean their feet before entering your spa.

Allow for Service Access
If you are installing your spa near a wall or with any type of structure on the outside, such as a gazebo, remember to allow access for service.
240 Volt Electrical Installation  
(North America 60Hz)

**WARNING:** The electrical circuit must be installed by an electrical contractor and approved by a local building or electrical inspector. Customer must provide a disconnect in the fixed wiring.

Failure to comply with state and local codes may result in fire or personal injury and will be the sole responsibility of the spa owner.

Improper installations present hazards which can result in personal injury or property damage and void the warranty on the spa.

Spa jumpers and dip switches are preconfigured for a 240V installation.

- All 240V spas must be permanently hardwired to the power supply. See US wiring diagram on page 9, European wiring diagram on page 10.
- Spas must be wired using this procedure. Any variance from these instructions will void your warranty and may result in serious injury.
- When installed in the United States, the electrical wiring of this spa must meet the requirements of National Electric Code, ANSI/NFPA 70-2008 and any applicable local, state, and federal codes.

**GFCI and Wiring Requirements**
- The power supplied to the spa must be on a dedicated GFCI protected circuit as required by ANSI/NFPA 70 with no other appliances or lights sharing the power.
- Use copper wire with THHN insulation. **Do not use aluminum wire.**
- Use the table on the next page to determine your GFCI and wiring requirements.
- When NEC requires the use of wires larger than #6 AWG, install a junction box near the spa and use #6 AWG wire between the junction box and the spa.
- Wire runs over 85 feet must increase wire gauge to the next lower number.
- Means for disconnection must be incorporated in the fixed wiring in accordance with the wiring rules.

**Testing the GFCI Breaker**
Test the GFCI breaker prior to first use and periodically when the spa is powered. To test the GFCI breaker follow these instructions

1. With spa operating, press the TEST button on the GFCI. The GFCI will trip and the spa will shut off.
2. Reset the GFCI breaker by switching the breaker to the full OFF position, wait a moment, then turn the breaker back on. The spa should have power again.

**Point of Entry for Electric Service**
Installations can vary greatly from spa to spa, therefore the manufacturer does not have any predetermined entry points for electrical service. The installer will need to determine the best point of entry, and create an entry point. Any of the 4 walls or the spa base can be drilled through to make this access point. Prior to drilling, be sure that there are no components on the interior of the cabinet that will possibly be damaged or in the way while making the hole. The manufacturer recommends that some form of moisture barrier is used at the hole to prevent water from entering the spa. As long as all the above criteria are met, this will in no way void the warranty that is included with the spa.

---

**Customer Service 1-800-787-6649**
Prepare for Your New Spa

GFCI Wiring Diagram (European 230V 50Hz)

Single Service, TN and TT Electrical Systems
3 Wires (1 Line + 1 Neutral + 1 Protective Earth)
Protective Earth wire 6mm² minimum
(Green/Yellow) must be connected to system ground terminal as marked.

This option is configured and shipped as the default.

All equipment (pumps, blower, and heater) runs on service line L1.

Systems using only 1 DIP switch (A10) for heat disable:
• For 1 x 16 Amp Service:
  DIP Switch A10 must be ON.
• For 1 x 32 Amp Service:
  Set DIP Switch A10 such that total system amperage draw never exceeds rated service input.

Systems using multiple DIP switches for heat disable:
• Refer to Switchbank settings on inside cover of pack.

Note: A residual current device with a tripping current rated not more than 30 mA has to be installed in addition to local requirement. Customer must provide a disconnect in the fixed wiring. Protective device for power connection must be on all phase conductors based on local requirements.

Dual Service, TN and TT Electrical Systems
5 Wires (2 Lines + 2 Neutrals + 1 Protective Earth)
Protective Earth wire 6mm² minimum
(Green/Yellow) must be connected to system ground terminal as marked.

The heater runs on service line L1, while all other equipment, such as pumps and blowers, run on service line L2.

Completely remove the white wire from J26 and J32.
Note: J32 and J25 are electrically identical. The white wire may be attached to either terminal before removal.

Systems using only 1 DIP switch (A10) for heat disable:
• DIP Switch A10 must be OFF.

Systems using multiple DIP switches for heat disable:
• Refer to Switchbank settings on inside cover of pack.

Note: A residual current device with a tripping current rated not more than 30 mA has to be installed in addition to local requirement. Customer must provide a disconnect in the fixed wiring. Protective device for power connection must be on all phase conductors based on local requirements.
Prepare for Your New Spa

For Certified Electrical Personnel reference ONLY!

230 Volt - Single service 1x16 - 20 AMP Breaker
230 Volt - Double service 1x32 - 40 AMP Breaker

Electrical Connections

<table>
<thead>
<tr>
<th>Two Wire &amp; Earth (Also known as Ground)</th>
</tr>
</thead>
<tbody>
<tr>
<td>L1 = Positive/Live = Brown wire</td>
</tr>
<tr>
<td>L2 = Negative/Neutral = Blue wire</td>
</tr>
<tr>
<td>GRND = Earth/Ground = Green &amp; Yellow wire</td>
</tr>
</tbody>
</table>

These wires go to the PC Board Control Circuit.

PLEASE CHECK YOUR LOCAL BUILDING CODES AND ONLY USE A CERTIFIED ELECTRICIAN TO INSTALL ANY ELECTRICAL COMPONENTS TO YOUR SPA. Substitute these common HOT, NEUTRAL, EARTH GROUND colors for your countries standard.

240V/50Hz 29 – 36 Amp draw, depending on model.
Filling and Starting

1. Place spa on an approved surface and have it properly wired by a licensed electrician.

2. Remove exterior spa panels by inserting a flathead screwdriver at bottom edge of resin panel and prying out. Or by prying out decorative plugs on UltraTec panels and unscrewing screws.

3. Make sure white plumbing unions are secure and did not loosen during shipping. There will be 4 unions on a 1-pump spa; 6 unions on a 2-pump spa. Hand-tighten any loose unions.

4. Open all gate valves in the equipment area. Before operation, these valves must be in the UP/OPEN position and have plastic clips inserted. Never run the spa with the gate valves closed or without water circulating for any period of time.

5. Remove the filter(s) (and weir and basket, if equipped) from filter chamber. Photos may vary from your particular spa model.

6. Place a garden hose in the filter chamber and fill your spa with regular tap water to 2” higher than the highest jet (excluding neck/shoulder jets).

Do not fill your spa with soft water. It is difficult to maintain proper water chemistry with soft water. Also, the water may foam, which will eventually harm the finish of the spa and void your warranty.

7. If you have an automatic bromine generator, turn it off.

8. Once the water is at the correct level and air is bled, turn on the power at the GFCI breaker. Note: When the power is turned on, the controls will perform a diagnostic check for a few minutes. When complete, the spa will automatically operate at filter speed and continue heating until water reaches 100°F.

9. If water does not flow from jets when the pump is running, there could be an air pocket. See next page, Priming the Pump, for methods of removing air pockets from the pump(s).

10. Install the filter(s) (and weir and basket, if equipped) into the filter chamber.
Priming the Pump

Sometimes air can become trapped in the pump while filling the spa. You will know this has happened when after you have filled and started the spa, the pump does not function. You will hear the pump operating, but no water will be moving. **The pump will not work properly while air is trapped in it. Continuing to operate the pump in this way will cause damage.**

New spa owners often have difficulty the first time they start their spa and the pump fails to prime. This can be frustrating, but these simple instructions can help you.

To remove small air bubbles trapped in the pump.

1. Turn the spa on and wait for **PR** (Priming Mode) to appear on the topside display.

2. Press the JETS1 button to turn on the pump and let it run for 10 seconds. The pump should be running on low speed.

3. Press the JETS1 buttons again and let the pump run on high speed for 10 seconds.

4. Press the JETS1 button again to turn off the pump. The pump should be left in the off position for 10 to 15 seconds.

5. Repeat steps 1 through 4 until water is flowing through all the jets and all air is removed from the plumbing.

To remove a large air lock within the pump:

1. Turn off power at the breaker.

2. Remove the spa panel closest to the pump.

3. Loosen the white Pressure Union on top of the pump by hand or with a strap wrench. When air is bled out, tighten the union, turn breaker on and set the pump on high speed.

Note: If you press the Temp button any time during Priming Mode, it will exit that mode and begin Standard Mode.
Operate Your Spa

Topside Control Panels

One-Pump Spas

System Settings
When your spa is first actuated, it will go into Priming mode, indicated by “Pr.” The Priming mode will last for less than 5 minutes (press “Warm” or “Cool” to skip Priming Mode) and then the spa will begin to take temperature readings, followed by the heater test cycle. After completed, the heater will turn on, heat the spa and maintain the water temperature in the Standard mode.

The start-up temperature is set at 100°F/37°C. The last measured temperature is constantly displayed on the LCD. Note that the last measured spa temperature displayed is current only when the pump has been running for at least 2 minutes.

To display the set temperature, press the “Warm” or “Cool” pad once. To change the set temperature, press the pad a second time before the LCD stops flashing. Each press of the “Warm” or “Cool” pad will continue to either raise or lower the set temperature. After 3 seconds, the LCD will stop flashing and display current spa temperature.

Maximum Temperature is set at 104°F/40°C as required by UL/CSA.
Minimum temperature is 80°F/26°C.

Note: If the spa is currently in a heating or filtration cycle the pump will only switch between high and low. It cannot be turned off until the heating or filtration cycle is completed.

Jets
Touch the “Jets” button once to turn the pump on or off, and to shift between low and high speeds. If left running, the low speed of the pump will automatically turn off after 2 hours, and the high speed will automatically turn off after 15 minutes.

Light
Press “Light” button to turn the light on/off. If left on, the light automatically turns off after 4 hours. See page 25 for lighting specifics.

Preset Filter Cycles
The first filter cycle begins 6 minutes after the spa is energized. The second filter cycle begins 12 hours later. Filter duration is programmable for 2-(C)ontinuous per 12 hours. The default filter time is 2 hours.

Example 1: In a 12 hour period (1 cycle), a setting of F2 means 2 hours of filtration on, 10 hours of filtration off.
Example 2: In a 12 hour period (1 cycle), a setting of F4 means 4 hours of filtration on, 8 hours of filtration off.

You may choose F2, F4, F6, F8 or c (continuous).
To program, press “Warm” then “Jets”. Press “Warm” to adjust. Press “Jets” to exit.

Mode
Mode is changed by pressing the “Warm” or “Cool” button, then pressing the “Light” button. In Economy and Sleep Mode, heating only occurs during the filter cycle. See Mode, page 18.

Freeze Protection
If the temperature sensors detect a drop to below 44°F/6.7°C within the heater, the pumps will automatically activate to provide freeze protection. The equipment stays on until 4 minutes after the sensors detect that the spa temperature has risen to 45°F/7.2°C or higher.

Control Pack Codes See pages 19-21.

One-Pump + Blower Spas or Two-pump (2-speed + 1-speed)

System Settings
When your spa is first actuated, it will go into Priming mode, indicated by “Pr.” The Priming mode will last for less than 5 minutes (press “Temp” to skip Priming Mode) and then the spa will begin to take temperature readings, followed by the heater test cycle. When complete, heater will turn on, heat spa and maintain the temperature in Standard mode.
The start-up temperature is set at 100°F/37°C. The last measured temperature is constantly displayed on the LCD. Note that the last measured spa temperature displayed is current only when the pump has been running for at least 2 minutes.

To display the set temperature, press the “Temp” pad once. To change the set temperature, press the pad a second time before the LCD stops flashing. The temperature will either go up or down. To change the temperature in the opposite direction, wait for the LCD to stop flashing, press the “Temp” pad once, then press the “Temp” pad again to reverse the temperature direction. After three seconds, the LCD will stop flashing and display the current spa temperature.

**Maximum Temperature is set at 104°F/40°C as required by UL/CSA.**
**Minimum temperature is 80°F/26°C.**

*Note: If the spa is currently in a heating or filtration cycle the pump will only switch between high and low. It cannot be turned off until the heating or filtration cycle is completed.*

**Jets**
Touch the “Jets” button once to turn the main 2-speed pump on or off, and to shift between low and high speeds. If left running, the low speed of the pump will automatically turn off after 2 hours, and the high speed will automatically turn off after 15 minutes. The “Boost” button will operate the blower pump, if equipped, or the 1-speed pump.

**Light, Preset Filter Cycles, Mode and Freeze Protection**
See page 14.

**Control Pack Codes**
See pages 19-21.

---

**Two-Pump Spas and Two-Pump + Blower Spas**

**System Settings**
When your spa is first actuated, it will go into Priming mode, indicated by “Pr.” The Priming mode will last for less than 5 minutes (press “Warm” or “Cool” to skip Priming Mode) and then the spa will begin to take temperature readings, followed by the heater test cycle. After completed, the heater will turn on, heat the spa and maintain the water temperature in the Standard mode.

The start-up temperature is set at 100°F/37°C. The last measured temperature is constantly displayed on the LCD. Note that the last measured spa temperature displayed is current only when the pump has been running for at least 2 minutes.

To display the set temperature, press the “Warm” or “Cool” pad once. Each press of the “Warm” or “Cool” pad will continue to either raise or lower the set temperature. After three seconds, the LCD will display the current spa temperature.

**Maximum Temperature is set at 104°F/40°C as required by UL/CSA.**
**Minimum temperature is 80°F/26°C.**

**Jets 1**
Touch the “Jets 1” button once to turn pump 1 on or off, and to shift between low and high speeds. If left running, the low speed of the pump will automatically turn off after 2 hours, and the high speed will automatically turn off after 15 minutes.

**Jets 2**
Touch the “Jets 2” button once to turn pump 2 on or off and to shift between low and high speeds. If left running, pump 2 will automatically turn off after 15 minutes.

**Option**
This button is used to turn on the blower pump in 3 pump spas (2 water pumps + 1 air pump).
**Light, Mode, Preset Filter Cycles and Freeze Protection**

See page 14.

**Control Pack Codes**

See pages 19-21.

---

**Three-Pump Spas and Two-Pump + Blower Spas**

---

**Temperature**

Temp Set (80°F - 104°F / 26.0°C - 40.0°C)

The last measured temperature is constantly displayed on the LCD. Your spa’s set temperature range may vary from range shown above depending on your manufacturer’s settings.

**Note that the last measured spa temperature displayed is current only when the pump has been running for at least 1 minute.**

**Maximum Temperature** is set at 104°F/40°C as required by UL/CSA.

**Minimum temperature** is 80°F/26°C.

**Cool/Warm**

Press the “Cool” or “Warm” button once to display the set temperature. Each time either button is pressed again, the set temperature will increase or decrease depending on which button is pressed. After three seconds, the LCD will automatically display the last measured spa temperature.

**Mode**

This button is used to switch between Standard, Economy, and Sleep modes. Press “Mode” to enter mode programming, press “Cool” to cycle through to desired mode (LCD flashes until confirmed), then press “Mode” to confirm selection.

**Standard mode** maintains the desired temperature. Note that the last measured spa temperature displayed is current only when the pump has been running for at least 1 minute. “Std” will appear on the display momentarily when you switch into Standard Mode.

**Economy mode** heats the spa to the set temperature only during filter cycles. “Ecn” will appear solid when the temperature is not current and will alternate with the temperature when the temperature is current.

Pressing “Jets 1” while in Economy mode puts the spa in **Standard-In-Economy mode**, (“SE”) which operates the same as Standard Mode, then reverts to Economy Mode automatically after 1 hour. During this time, pressing “Cool” or “Warm” followed by “Light” will revert the mode to Economy immediately.

**Sleep mode** heats the spa to within 20°F (11°C) of the set temperature only during filter cycles. “SLP” will appear on the display until mode is changed.

**Standby Mode**

Pressing “Cool” or “Warm” followed by “Blower” or “Jets 2” or “Aux” will turn off all spa functions temporarily. This is helpful when changing a filter. Pressing any button exits Standby mode. On some systems the “Jets 1” button will control the pump in Standby Mode (“Drain Mode”). In this case, press any other button to exit. System will revert to previous mode after 1 hour.

**Jets 1**

Press the “Jets 1” button once to turn pump 1 on or off, and to shift between low and high speeds if equipped. If left running, the pump will turn off after a timeout period. The pump 1 low speed timeout on some systems may be as long as 4 hours.

On non-circ systems, the low speed of pump 1 runs when the blower or any other pump is on. It may also activate for at least 1 minute every 30 minutes to detect the spa temperature (polling) and then to heat to the set temperature if needed, depending upon mode. When the low speed turns on automatically, it cannot be deactivated from the panel; however, the high speed may be started.

**Jets 2** (optional on some systems)

Press the “Jets 2” button once to turn pump 2 on or off. If left running, the pump will turn off after a
timeout period.

**Jets 3** (optional on some systems)
Press the "Jets 3" button once to turn pump 3 on or off. If left running, the pump will turn off after a timeout period.

**Blower**
1-speed operation: on/off; If left on, the blower will automatically turn off after a timeout period.

**Light**
Press the “Light” button to turn the spa light on and off, and to switch between different colors. If any light is left on, it will automatically turn off after a factory-programmed time period.

**Preset Filter Cycles**
On all systems, the pump and the ozone generator will run during filtration. At the start of each filter cycle, the blower will run briefly to purge the air channels. The other pumps will also run briefly.

**Freeze Protection**
If the temperature sensors within the heater detect a low enough temperature, then the pump(s) and the blower automatically activate to provide freeze protection. The pump(s) and blower will run either continuously or periodically depending on conditions. In colder climates, an optional additional freeze sensor may be added to protect against freeze conditions that may not be sensed by the standard sensors. Auxiliary freeze sensor protection acts similarly except with the temperature thresholds determined by the switch. See your dealer for details.

**Control Pack Codes** See pages 19-21.

---

**Operational and Energy Tips**

1. **Control Valves** – air and water controls on the top of spa
   a. **Average to Cold Climate** - When not in the spa, make sure the valves are turned off. All these valves will inject a certain amount of air into the water which causes a cooling effect. Therefore your spa will have to heat more often and cost more money to operate.

b. **Hot Climate** – Hot tubs are only designed to heat up and maintain temperature, therefore hot climate can actually make a spa over heat. In these areas, the control valves can be left open all the time to help cool the spa down.

2. **Filter Settings – Time and Duration**
   a. **Filter settings** – review your owner's manual for specific details
      i. **Filter times** - if your spa has a clock to set, then you set the filter time by the hour and need to change in your programming menu. If no clock then you simply set your filter time by when the spa is turned on. If you power the spa up at 8:00am, then it will filter at 8:00am and 8:00pm daily until the power is turned off and on again.
         1. **Savings** – if your electric provider offers different rate per KWH (peak / off-peak) then you will want your filter time to take place during off-peak time.
         2. **Cooling a Spa** – if you are experiencing over heating with your spa, have the spa filter during cooler times of the day, and leave the control valves opened like mentioned prior.
   ii. **Filter setting F2,F4,F6,F8,and FC = filter constantly**
      1. The factory setting is F2, which means the spa will filter 2 hours for every 12 hour period. 4 hours total per day. Since we use a large primary pump for your filtration, it moves a lot of water quickly. Therefore we recommend you keep your filtration at no more than F4, anything longer will just waste electricity and in warm climates the spa may overheat.

3. **Heating Modes** – (Balboa Controllers)
   a. **Standard, Economy, and Sleep**
      i. **Standard is the default setting**, and you are in standard mode if none of the other setting
Operate Your Spa

1. Temperature will be at or near desired temperature constantly
2. Pumps turn on at regular intervals to check and maintain temperature
3. Best to use at startup of spa, it will heat until desired temperature is reached
4. Best to use in cold climates
5. Most costly to operate

c. Economy – Ec, Ecn
   i. Economy is the power saving alternative for regular heating, you will know that you are in economy by the code displayed. If the pump is running the current temperature and code will alternate on the display.
   1. Spa will only heat during filter period
   2. Temperature will remain close to desired, but it will drop between filter periods
   3. If users can get in a routine, filter period should overlap the usage time by a half hour. This will have spa temperature closest to the desired temperature.
      a. Example, if using the spa at 8:00 have spa filter from 6:30 – 8:30.
   4. Best used in mild to warm climates
   5. Tests show a 20% reduction in energy consumption when compared to standard mode

d. Sleep – Sl, SLP
   i. Sleep is considered a vacation heater setting, and will maintain your spa water at the most affordable price
   1. Spa will only heat during your filter period
   2. The water temperature may drop up to 20 degrees below your desired temperature
   3. Will work in all climates, and will not allow the spa to freeze
   4. Tests show a 50%+ reduction in energy consumption when compared to standard mode

4. Steam Loss / Venting Around Spa Cover
   a. It is normal to see an occasional burst of steam from around the cover due to pressure releasing from a high to low area. However heat loss can be greatly impacted by use of the spa
      i. Control valves should be turned off when getting out of the spa in a cool climate.
         1. Air injects from the cabinet and enters into the water area. That air not only will cool the cabinet area, but will also greatly increase the pressure under the cover and cause more steam to release.
      ii. Surfaces are different for all spas, and covers may provide a better seal is spun differently.
         1. If the folding seam goes over the controller area, often more steam will be able to escape. Try to position the cover so that the fold seam goes over the wider top surface areas on the adjacent sides.

Mode

Standard Mode is programmed to maintain the desired temperature. Note that the last measured spa temperature displayed is current only when the pump has been running for at least 2 minutes. “ST” will be displayed momentarily when you switch into Standard Mode. This is the best mode to use during COLD weather.

Economy Mode heats the spa to the set temperature only during filter cycles or if the temperature falls to 20 degrees below set temperature. “EC” will display solid when temperature is not current, and will alternate with temperature when temperature is current. This is the best mode to use during WARM weather.

Sleep Mode also heats the spa to the set temperature only during filtration cycles. “SL” will display solid when temperature is not current, and will alternate with temperature when temperature is current, but only within 20 degrees of your set temperature.

Pack Reset Instructions VS and GS Models

Tools: Phillips head screwdriver, Needle nose pliers (optional)

First, turn the power off to the spa by using the breaker disconnect. Then, remove the cover to the pack (electrical control unit inside spa). Locate the board diagram on the inside of the cover, and find J43 Persistent Memory. This is located approximately ¾” above and ½” to the right the red dipswitch bank. It is a small black piece of plastic located between two yellow pieces connected to the board. The jumper on J43 should be hanging on one (1) pin and in a vertical position. Using needle nose pliers (or fingers) gently grab the black jumper and remove from the board. Next, put the jumper back on the pin it came off of in the horizontal position using it to connect the adjacent pin. Proceed to turn the power back on to the spa. Once you see “PR” on the top display, wait one (1) minute and turn the breaker back off. Now reverse the process. Take the black jumper off of both pins and reposition vertically on just one pin (this is done just as a place-saver so the jumper does not become lost). Replace the cover to the pack, and power the spa back on.

Pack Reset Instructions STREL Model

Tool: Phillips head screwdriver

First, turn the power off to the spa by using the breaker disconnect. Then, remove the cover to the pack (electrical control unit inside spa). Once the cover is removed, locate the board diagram on the inside of the cover, and find the red dip switch bank. Using your screwdriver (or fingers) gently switch #12 (the one farthest from you) to the ON position (to the left). Proceed to turn the power back on to the spa. Once the display returns, wait one (1) minute and turn the breaker back off. Now reverse the process, move dip switch #12 back to the off position (to the right). Replace the cover to the pack, and power the spa back on.
Operate Your Spa
Operate Your Spa

Personalized Settings

Jets
Most jets in your spa are adjustable. Rotating the face of an adjustable jet to the left (counter-clockwise) will increase the amount of water flow through the jet. Rotating the face of an adjustable jet to the right (clockwise) will decrease the amount of water flow through the jet.

Neck jets can be turned on and off using the nearby water on/off knob.

Blower jets are not adjustable, but can be turned on and off using the Aux or Option button on your Control Panel.

Air Controls
Air controls are the 2” knobs located around the top of your spa. Each one will let you add a mixture of air with the jet pressure. This is accomplished by rotating the air control knob to the left (counterclockwise) to increase the amount of airflow through the jets. To decrease the amount of airflow through the jets, rotate the handle to the right (clockwise).

Diverter Knobs (if equipped)
Diverter knobs are 3” knobs located around the top of your spa. They allow you to divert water through jets from one side of the spa to the other, or in most cases from floor jets to wall jets. This is accomplished by rotating the diverter knob to the left (counterclockwise), decreasing the amount of water flow through a section of jets. To increase the amount of water flow through the other section of jets, rotate the handle to the right (clockwise).

Remotes (if equipped)
Remote Controls operate like the Jets button on your control panel. For dual-speed pumps, press the center of the remote once to turn pump on low, again to turn pump on high, and a third time to turn the pump off. One remote control operates Pump 1, the other operates Pump 2.

On models equipped with one-speed secondary and tertiary pumps, press the center button once to turn pump on and once to turn off. One remote control operates Pump 2, the other operates Pump 3.

Waterfall Controls (if equipped)
Some spas include waterfalls. Increase or decrease the flow of the waterfall using the 2” water on/off knob nearest the waterfall.
**Pop-up Water Columns (if equipped)**

**IMPORTANT!**

When spa session is over, and before cover is closed, these pop-up water features MUST be turned off using the water control knob nearest the feature. Pushing them down by hand or with the weight of the cover will not turn them off, and water will continue to run through them, potentially causing draining of your spa, depending on how long they are left on.

---

**Lighting**

**Underwater Light, LED Points of Light on Spa Shell and/or Spa Perimeter (if equipped)**

Press the **Light button** on the topside control panel to turn the spa light on. If your spa has perimeter LED lights, they will also light up at the same time as the spa light. Perimeter lights operate in four modes. The mode is changed by turning the light off and then immediately back on.

1. **Fading:** The first time you press the **Light button**, the lights will cycle through all the colors in this order: White, Cyan, Magenta, Blue, Yellow/Green, Green, Red

2. **Color Locked:** This cycle offers a hard color change without fading.

3. **Quick Color Change:** To cycle through the different color choices, press the **Light button** repeatedly. Each time you press the button, you advance to the next color.

4. **Flashing white:** When you have cycled through all the colors, the next time you push the **Light button**, the LED lights will flash white.
Maintaining Spa Water Quality

Testing and Adjusting Water

As the owner of a spa, it is important that you maintain your spa water and keep your spa equipment in excellent condition. To do so, you must first balance your spa water. If your spa is equipped with an ozone generator, it will automatically produce ozone, but it cannot be used as the sole means of maintaining safe spa water. You must select and use a spa chemical system in addition to your ozone generator. The ozone generator is a wearable, non-warranty item and it needs to be replaced approximately every two years.

Routine Water Maintenance

Good spa water requires regular maintenance. Establish a routine based on a regular schedule for your spa water maintenance. Maintaining your water quality helps the enjoyment of your spa and extends your spa's life. See page 30.

Sanitation

You will need to decide which chemical sanitizer you wish to use, regardless of the presence of an ozonator. Spa owners with an ozonator still need to use a chemical sanitizer. Sanitizers kill bacteria and viruses and keep the water clean. A low sanitizer level will allow microbes to grow quickly in the spa water. Use either bromine or chlorine as your sanitizer or a non-chlorine/non-bromine sanitizer. All work well when maintained regularly. Consult your spa dealer for the right decision with regards to your lifestyle and spa usage.

This manual will cover general chlorine sanitation only. See page 27.

The manufacturer does hereby claim no responsibility or liability for use of and quantities of the chemicals used. Read and follow all label instructions.

Do not use third-party salt-based systems in your spa! Damage caused by salt-based systems that have not been factory installed will not be covered under your warranty.

Ozone

Ozone is a natural purifier. Chemically known as O₃, it is produced from simple oxygen molecules in our atmosphere. Ozone is produced in nature from lightning during electrical storms and from ultraviolet rays from the sun. It forms our protective ozone layer. Your spa's ozone generator is designed to duplicate this natural sanitizer. Ozone breaks down and oxidizes oils, suntan lotions, sweat, urea, etc. from spa water more effectively than commercial oxidizers. Ozone works with chlorine or bromine systems in your spa to destroy bacteria and viruses and will do so more effectively. Ozone only leaves simple oxygen in the water as a by-product.

Filtration

Cleaning your filter regularly is the easiest and most effective single thing you can do to keep your water clear. A clogged or dirty filter will cause the heater and pump to work harder than they need to, possibly causing them to fail. The spa's heating system will only function with the proper amount of water flow through the system. See page 29.

The filtering cycle of your spa should be operated at least two hours or more a day (whether or not the heater is heating) to remove impurities and to prevent disposition of contaminants in your spa. The filtering system works automatically. Keep the spa covered when not in use to reduce the loss of heat and to keep debris from settling in the water. See pages 15-19.

Chemical Balance

You will need to test and adjust the chemical balance of your spa water. Although this is not difficult, it needs to be done regularly. Depending on your choice of sanitizer, you need to test the level of calcium hardness, total alkalinity, and pH. See pages 27-29.

Testing Methods

There are 2 types of testing methods:
• The reagent test kit is a method which provides a high level of accuracy. It is available in either liquid or tablet form.
• Test strips are a convenient testing method commonly used by spa owners.
Balancing the Total Alkalinity

Total alkalinity (TA) is the measure of the total levels of carbonates, bicarbonates, hydroxides, and other alkaline substances in the water. TA can be considered a pH buffer. It is the measure of the ability of the water to resist changes in pH level.

The recommended total alkalinity is 80 - 120 ppm.

If the TA is too low, the pH level will fluctuate widely from high to low. Low TA can be corrected by adding alkalinity increaser.

If the TA is too high, the pH level will tend to be too high and may be difficult to bring down. High TA can be corrected by adding pH decreaser.

When the TA is balanced, it normally remains stable, although adding water with high or low alkalinity will raise or lower the TA level.

Balancing the Calcium Hardness

Calcium hardness (CH) is a measure of the total amount of dissolved calcium in the water. Calcium helps control the corrosive nature of the spa’s water and is why soft water is not recommended. The low calcium content of soft water is very corrosive to the equipment and can cause staining of the spa shell.

The recommended calcium hardness is 150 - 200 ppm.

If the CH is too low, add liquid hardness increaser.

If the CH is too high, dilute the spa water with soft water or, if this is not available, add stain and scale defense.

When the CH is balanced, it normally remains stable, although adding soft water or very hard water will raise or lower the CH level.

Balancing the pH

The pH level is the measure of the balance between acidity and alkalinity.

The recommended pH is 7.2 - 7.6.

<table>

</tr>
<tr>
<td>6.6</td>
<td></td>
</tr>
</tbody>
</table>

If the pH is too low, it can cause corrosion of metal fixtures and the heating element. See chart to balance.

If the pH is too high, it can cause scaling by allowing metals or minerals to form deposits and stain spa surfaces. See chart to balance.

If Using Chlorine as a Sanitizer

- If you choose to use chlorine as a sanitizer, only use granulated chlorine, not liquid chlorine.
- Once a week, check the chlorine level using either a test strip or a reagent kit. See table for the ideal range.
- Add one or two tablespoons of chlorinating granules to the spa water weekly. Note that chlorine dissipation rate will be faster at higher water temperatures and slower at lower temperatures.
- When you add chlorine, make sure no bathers are in the spa, open all jets and run the spa at high speed with the cover open for at least 30 minutes.
- Follow the maintenance schedule on page 30.

If Using Bromine as a Sanitizer

Bromine is a very effective sanitizer that produces low chemical odors. Unlike chlorine, it can break down bacteria and other impurities to a safe level with a low burn-out rate. The bromine generator requires different water chemistry tests from chlorine systems.

If you choose to use a bromine generator, you can purchase one at your spa retailer. Retail specialists will help you determine the best product to purchase and can recommend supplies, procedures and maintenance schedules.
Maintaining Spa Water Quality

### Chemical Safety

Read and follow all printed instructions listed on bottles and packages. Failure to follow chemical directions may result in serious injury, sickness, or even death.

Add chemicals to the center of the spa with the pump running. Make sure the water is heated. Never add chemicals to cold water, as this will effect chemical action. Also, never add chemicals directly into the skimmer.

- **WARNING!** Never add chemicals to your spa while bathers are in the spa!
- **WARNING!** Never change chemical brands or types without completely draining, flushing and thoroughly cleaning the spa and cover first.
- Do not exceed chemical dosages as recommended on chemical bottles and packages.
- **WARNING!** Never mix chemicals together.
- **WARNING!** Always wear protective gloves while working with chemicals.
- **WARNING!** Do not allow chemicals to come in contact with skin, eyes or clothing. Remove and wash clothing that may have been exposed to chemical contact prior to wearing them again.
- **WARNING!** Inhaling or ingesting chemicals will cause serious injury, sickness, or even death.
- **WARNING!** Chemicals must be stored completely out of the reach of children in an area that is well vented, cool, and dry. Failure to provide a proper area for chemical storage may result in serious injury, sickness, fire explosion and even death. Do not store your chemicals inside the equipment area of your spa.

Maintaining Spa Water Quality

Shocking the Water
In addition to using a chemical sanitizer, you will periodically need to shock the water. Shocking the water helps remove burned-out chemicals, bacteria, and other organic material from your spa’s water and improves your sanitizer’s effectiveness.

Do not use chlorinating shock, which will damage your spa’s jets and pump seals. Only use oxidizer shock. It is an easy way to maintain chemical plans.
For best results use the directions below.
Add one ounce of oxidizer shock:
• Once a week
• After heavy bather loads
• If water has a strong odor

Spa must be running with all of the jets on high for 30 minutes with the cover open. If necessary, repeat oxidizer shock in 30 minute intervals.

Filter Cleaning
The filter is the part of your spa that removes the debris from the water and needs to be cleaned on a regular basis to maximize your spa’s filtering performance and heating efficiency.

In addition to spraying off the filter weekly to remove surface debris, your filter should be deep cleaned periodically to dissolve scale and particles that get lodged deep within the filter fibers and impede the filtration process. Even if the filter looks clean, scale and particles can clog the fibers and prevent water from flowing through the filter resulting in the most common spa problem – no heat, caused by a dirty filter.

We recommend you clean your filter once a month and replace it once every 6 months or as necessary.
1. Clean the surface of the spa with non-abrasive cleaner.
2. Fill the spa to the proper water level with normal tap water. (Do not use soft water.) Heat your spa to at least 90°.
3. Use test strip and balance the spa water.
   • Adjust total alkalinity (acceptable range is 80-120ppm).
   • Adjust pH if necessary (between 7.2 to 7.8).
4. Add stain and scale prevention.
5. Turn on jets for 15 minutes. Leave spa uncovered during this time.
6. Put cover on spa and allow to heat up to desired temperature.

Water level is very important. If the water level is too low or too high, your spa will not operate properly. The water level should be about two inches over the highest jet (excluding neck/shoulder jets) when the spa is not being used.

Tip: Keep a spare filter to use in the spa while the dirty filter is being deep cleaned.

Starting with Fresh Water
Consult dosage recommendations on the containers that your chemicals are packaged in since they may have similar names and/or usage descriptions but due to manufacturing differences, there is the likelihood of under- or over-dosing the spa chemicals. Damage to the spa or spa components from improper chemical usage is not covered under the spa’s warranty. Important: Make sure the water is heated. Never add chemicals to cold water, as this will effect chemical action. Add chemicals to the center of the spa with the pump running.

Prior to filling a spa for the first time, or after a routine draining, follow this start-up procedure. Adjust the chemical dosages to the capacity of your particular spa, following label recommendations.
1. Clean the surface of the spa with non-abrasive cleaner.
2. Fill the spa to the proper water level with normal tap water. (Do not use soft water.) Heat your spa to at least 90°.
3. Use test strip and balance the spa water.
   • Adjust total alkalinity (acceptable range is 80-120ppm).
   • Adjust pH if necessary (between 7.2 to 7.8).
4. Add stain and scale prevention.
5. Add two tablespoons of chorine granules to the spa water.
6. Turn on jets for 15 minutes. Leave spa uncovered during this time.
7. Put cover on spa and allow to heat up to desired temperature.

Water level is very important. If the water level is too low or too high, your spa will not operate properly. The water level should be about two inches over the highest jet (excluding neck/shoulder jets) when the spa is not being used.
Maintenance Schedule

Each time you refill the spa
• Follow the section Starting with Fresh Water.

Prior to each use
• Test the spa water using either test strips a reagent test kit. Adjust chemical levels as necessary.

Once a week
• Test the spa water using either test strips a reagent test kit. Adjust chemical levels as necessary.

Once a month
• Deep clean your spa’s filter. See page 29.
• Apply spa vinyl cleaner/protectant to vinyl spa soft cover and pillows.

Every two to three months
• Drain and clean your spa with non-abrasive cleaner.

• Polish shell with acrylic surface cleaner.

• Refill your spa, following the section Starting with Fresh Water.

Every four to six months
• Change your spa water. You may find the need to change your spa water more frequently with heavy use. When empty, your spa should be cleaned with a non-abrasive cleaner and then rinsed thoroughly.

Once a year
• Replace filter cartridges if the pleats appear frayed.

Every 2 years
• Replace your ozonator.

Draining Your Spa

Your spa should be drained every four to six months, and refilled with fresh tap water. The following is the recommended method for draining your spa.

1. Turn off the power at the breaker.
2. Remove all filters.
3. Your drain valve is located inside the spa cabinet.
4. Locate hose ending with the 3/4 inch hose shut-off valve.
5. Hook up the female end of a garden hose to the drain fitting.
6. Place the other end of the garden hose where you would like the water to drain to.
7. Twist the hose shut-off valve counterclockwise to open the drain.
8. Let spa drain completely, then remove garden hose.
9. Twist the hose shut-off valve clockwise to close it and replace cap.

Vacation Care

You can leave your spa unattended for up to two weeks if you follow these instructions.

- ALWAYS lock your cover using the cover locks if you plan to be away from home and the spa is filled with water.
- Set the spa to Sleep Mode. (See instructions on page 15-19 for changing modes.)
- Following the water quality instructions starting on page 26, adjust the pH.
- Shock the water (add either chlorine or bromine sanitizer).
- When you return, check and adjust the pH and shock the water.

If you will not be using your spa for longer than 14 days and a spa maintenance service is not available, we strongly recommend you drain or winterize your spa. See page 38 for Winterization Procedure.

Water drained from your spa is safe to dispose of in your yard, septic system or in a drain. Follow all local/municipal codes and regulations for disposal.
Cleaning and Care

Cleaning Your Spa

Spa Shell
Each time you drain your spa, before you refill it you should clean your spa shell with a low detergent, non-abrasive cleaner specifically formulated to clean the spa without damaging its acrylic finish.

1. Spray cleaner directly to the spa’s finish.
2. Wipe clean with a soft cloth.
3. Repeat on heavily calcified areas.
4. Wipe spa thoroughly with a wet sponge, rinsing often in a bucket of clean water.
5. Allow the spa to dry completely.

*Important*: Do not use any of these products on spas full of water. Only apply to clean, cool, dry surfaces. Incorrect product usage may cause water issues.

Resin Spa Surface
For normal care and cleaning, use a soft cloth or sponge with soap and water. Rinse well and dry with a soft, clean cloth.

- Clean grease, oil, paint and ink stains with isopropyl (rubbing) alcohol. Rinse well and dry with a soft, clean cloth.
- Never use abrasive cleaners.
- Do not allow your surface to come into contact with nail polish, nail polish remover, wintergreen oil (methyl salicylate), dry cleaning solution, lacquer thinners, gasoline, pine oil, etc.
- Avoid placing razors or other sharp instruments on this surface as they may scratch it. Small scratches can be removed by buffing lightly with a clean cloth and using either an automotive polishing liquid or a toothpaste containing a fine polishing ingredient. For deeper scratches, sand the surface lightly with 400 grit “wet or dry” paper and buff with fine-grit buffing compound.

Spa Cover and Pillows
Protect spa cover and pillows by applying a spa vinyl cleaner as part of your monthly maintenance plan. It is specifically designed to protect spa covers and pillows from chemical and ultraviolet light damage without leaving an oily residue behind.

Warning: Do not use automotive vinyl protectants on spa covers or pillows. These products are generally oil-based and will cause severe water clarity issues that are difficult to correct.

*Important! Keep the spa covered when not in use!*
- Covered spas will use less electricity in maintaining your set temperature.
- Covering your spa will protect your spa’s finish from the sun’s ultraviolet rays.
- You are required to keep the spa covered to maintain warranty coverage.
- Covering your spa helps prevent children from drowning in the spa. See the photo for instructions on mounting the locks and how to lock and unlock the cover.
- In addition, while a soft spa cover is rigid, it is not designed to support any weight. Therefore, as a safety precaution and to preserve the life of your cover, you must not sit, stand, or lie on it, nor should you place objects of any kind on top of it.

Jet Removal and Replacement

1. Rotate the jet face counterclockwise.
2. Continue to rotate the jet as you pull it out of the jet well.

To replace jets, insert the jet in the jet well and push and rotate it clockwise until you feel it snap into position. When the jet face can be rotated freely, it is properly seated.
Removing and Reseating the Pillows

You can remove the pillows for cleaning and maintenance quickly and easily. This method works for all types of pillows.

**To attach ‘U’-shaped pillows:**
Press plugs gently into sockets.

**To remove ‘U’-shaped pillows:**
Pull gently upward on pillow.

**To attach rectangular pillows:**
1. Hold pillow LOWER than the final pillow position.
2. Drag the pillow UPWARD allowing the BOTTOM of the bracket to enter the slot in the pillow first.
3. As the pillow begins to attach to the bracket, press inward on the center of the pillow with your fingers.
4. The pillow will snap into place.

### Sound System Feature

*(if equipped)*

Several options are available and include marine grade stereos. Spas equipped with an audio system are delivered with the manufacturer's operating instructions. Also:

- Make sure that hands are dry before use.
- Water damage is not covered by spa manufacturer or the sound system manufacturer’s warranties.
- The system is water resistant but NOT waterproof. Take every precaution to keep this system dry. Water damage is not covered by spa manufacturer or the sound system manufacturer’s warranties.

---

**WARNING**

- “CAUTION – Risk of Electric Shock. Do not leave compartment door open.”
- “CAUTION – Risk of Electric Shock. Replace components only with identical components.”
- “Do not operate the audio/video controls while inside in the spa.”
- “WARNING – Prevent Electrocuton. Do not connect any auxiliary components (for example cable, additional speakers, headphones, additional audio/video components, etc.) to the system.”
- These units are not provided with an outdoor antenna; when provided, it should be installed in accordance with Article 810 of the National Electrical Code, ANSI/NFPA 70
- Do not service this product yourself as opening or removing covers may expose you to dangerous voltage or other risk of injury. Refer all servicing to qualified service personnel.
- When the power supply connections or power supply cord(s) are damaged; if water is entering the audio/video compartment or any electrical equipment compartment area; if the protective shields or barriers are showing signs of deterioration; or if there are signs of other potential damage to the unit, turn off the unit and refer servicing to a qualified service personnel.
- This unit should be subjected to periodic routine maintenance (for example, once every 3 months) to make sure that the unit is operating properly.
**Winterizing and De-Winterizing Your Spa**

**Winterization Procedure**

*Important: Damage caused by improper winterization is not covered under the manufacturer’s warranty.*

1. **Turn off power at the GFCI circuit breaker before draining or servicing your spa.**

2. Remove exterior resin panels by inserting a flathead screwdriver at the bottom edge of the panel and prying out (Figure 1) or by prying out decorative plugs and unscrewing screws on UltraTec panels.

3. Attach a garden hose to the drain and open the blue ball valve (Figure 2). Water will start to drain. You may have some water left in the spa shell that did not drain. Remove it with a wet-vac or by hand with a small cup.

   *Water drained from your spa is safe to dispose of in your yard, septic system or in a drain. Follow all local/municipal codes and regulations for disposal.*

4. Loosen all large white unions from heater and pump(s) to let excess water drain from the lines (Figure 3). Your spa may have more than one pump. Be sure to follow winterization procedures for each pump and all unions. A one-pump spa has 4 unions; a two-pump spa has 6.

5. Remove lowest drain plug on front of each pump (Figure 4). Drain out any water in pump(s).

6. After the spa has drained, you MUST also use a wet-vac to remove the water from the lines by vacuum/suction. Water left in the lines and jets will freeze and damage them.

   To adequately clean out the lines, place the wet-vac for 10-15 seconds over: each drain (Figure 5); each union (Figures 6 and 7); each jet face (Figure 8); each suction (Figure 9); and the filter cavity (Figure 10). See filter removal procedure.

7. After all the water is removed from the spa, jets, and plumbing, re-insert drain plug into each pump (Figure 4). Tighten all unions and make sure all gate valves are open with clips installed (Figure 3).

8. Pour a gallon of spa antifreeze into the top of each pump (Figure 11) and a gallon into the filter cavity (Figure 12).

9. Replace all exterior panels.

10. Close your spa cover.
Winterizing and De-Winterizing Your Spa

De-Winterization Procedure

1. Fill the spa’s footwell with water.
2. Drain the spa to clear the antifreeze out of the spa. See page 35. Draining Your Spa, for procedure.

Important: Damage caused by improper winterization is not covered under the manufacturer’s warranty.

If you have any questions, please call Technical Support at 1-800-787-6649.

You may also wish to contact a professional to perform these services for you.

Water drained from your spa is safe to dispose of in your yard, septic system or in a drain. Follow all local/municipal codes and regulations for disposal.
Product Registration

Register your spa online!
Go to strongspas.com and click on Register.

It is important that you register your product as soon as possible.

IMPORTANT:
Warranty is void if the spa is moved to any location that is not the original ‘Ship To’ address.

Locating the product serial number
The serial number of your spa is located on a metal plate attached to exterior of the spa.
You will need this number to properly register your spa and activate coverage.
Write this information in the space provided below.

Please have the following information ready when registering your spa.

Spa Model: ________________________________________________________________

Spa Serial Number: __________________________________________________________

Date Purchased: ____________________________________________________________

Date Delivered: ____________________________________________________________

Date Installed: ______________________________________________________________

Dealer/Vendor Name ________________________________________________________

Dealer/Vendor Phone Number: ________________________________________________

Dealer/Vendor Address: ________________________________________________________
